FOREWORD

The Iowa Crop and Livestock Reporting Service is the Iowa unit of a nation-wide organization which is entrusted with the responsibility of operating a standard statistical service for agriculture. The Division of Agricultural Statistics is a division of the Iowa State Department of Agriculture working in cooperation with the Agricultural Marketing Service of the United States Department of Agriculture. The year 1939 marked the one-hundredth anniversary of the collection of statistics of agriculture in the United States.

The general program of the Iowa Crop and Livestock Reporting Service is to meet the public needs and demands for summary data of a historical nature and for current statistical information of agricultural production in Iowa and the United States.

In recent years, there has been an increasing demand from agricultural organizations, commercial interests, teachers, legislators, and county, state and governmental agencies for agricultural data showing the trends of change in counties. Little has been done in the past to make available data for each county over an extended period of time. So urgent is the need for county data that some organizations have assembled such information at considerable cost. It is in response to these needs that this series is being issued.

The county data herein offered have been assembled from existing State and Federal documents and reports under the supervision of Norman V. Strand, State-wide Work Projects Administration Supervisor of Agricultural Economics and Statistics projects. This is a report of work completed on Official Project 65-1-72-155 of the Work Projects Administration. Official Project 665-72-3-36 furnished the material for Tables 28 and 30.

The Iowa Agricultural Extension Service participated in the preparation of the materials in this report. Selected data from the files of the Iowa Agricultural Experiment Station have been released for publication in this series. Special credit is given to the Iowa assessors and tax officials who collect data on crops and livestock as required under the Iowa laws. Without these data by townships and counties detailed agricultural statistics would be less accurate and less complete.

Leslie M. Carl, Director
Division of Agricultural Statistics

Des Moines, Iowa

IOWA AGRICULTURAL STATISTICS - LINN COUNTY

Linn County was established by the Winsconsin Territorial Legislature, December 21, 1837 1/ and named for Lewis F. Linn, United States Senator from Missouri.

In February, 1838, John Mann of Pennsylvania, settled at Linn Grove on Upper Big Creek; he was drowned in a flood in 1851. John Crow of North Carolina took a claim on the Wapsipinicon River in April, 1838. Soon after settlements were made in Franklin Township, Linn Township, in Marion and other localities. In July, 1838, Israel Mitchell laid out the first town and named it Westport and in September, of the same year, William Stone staked out a town plat where Cedar Rapids now stands and named it Columbus. The first cabin on the present site of Cedar Rapids was built by an outlaw by the name of Shepard in the same year. It was for a long time the rendezvous of a gang of horse thieves, outlaws and counterfeiters that infested that region in early days; their stolen property was secreted among the islands of the Cedar River. The gang was broken up in 1851. The first permanent settlement at that place was made in 1839 by T. Gaines and D. W. King who took up claims and made a settlement on the west side of the river. The town was formally laid out in 1841. 2/

The first railroad to reach the county was the Northwestern, which came just within the border to Lisbon in 1853 and the following year extended to Cedar Rapids; with the arrival of the Dubuque and Southwestern Railroad in 1865 the city of Cedar Rapids became an important railroad center. 3/

Area

Linn County is thirty miles long by twenty-four miles wide embracing 709 square miles 4/ or 453,760 acres of which 423,576 acres are listed as farm lands. 5/ There are 20 townships in its area--many irregular in shape owing to their river boundaries. It ranks 13 in point of size in the State.

Soils

The soils of Linn County have been grouped into four classes according to their location and origin; namely, drift, loess, terrace and swamp and bottom-land. The drift soils comprise 69.6 per cent of the entire surface and are divided into the Carrington silt loam--49.7 per cent, the Carrington loam--10.0 per cent, Carrington fine sandy loam--2.6 per cent; Carrington very fine sandy loam--0.4 per cent. The loess soils take up 18.1 per cent of the total and are divided into the Clinton silt loams--8.8 per cent, Tama silt loam--3.4 per cent, Lindley loam--0.7 per cent, Lindley fine sand--0.5 per cent and the Lindley very fine sand--0.4 per cent. The terrace soils cover 6.4 per cent of the area and have nine types represented by very small percentages, the two largest being the Buckner silt loam--2.1 per cent and the Bremer--1.0 per cent. The swamp and bottomland soils have 5.9 per cent of the total area and are divided into the Wabash silt loam--3.5 per cent, Cass loam--0.8 per cent, Cass silt loam--0.6 per

cent, Cass fine sandy loam--0.6 per cent, Sarpy fine sand--0.3 per cent and muck--0.1 per cent. 6/

Topography

The surface of this county is, in general, gently rolling, sloping towards the southeast. This is particularly true of the central portion of the area between the Wapsipinicon and Cedar Rivers. In some areas the land is almost flat. Along the valleys of the larger streams there are rounded, glacial hills and long ridges, many of which are covered with a thin layer of loess, along the Cedar these hills and ridges occur chiefly to the north of the river; these rounded hills are found on both sides of the Wapsipinicon, reaching their greatest height near Waubeek. Alluvial plains, one to two miles in width, occur along the larger streams and in some instances the upland loess ridges border the streams which pass through narrow, deep gorges making the surface quite rugged.

The drainage, with the exception of a small area in the southwestern part, is accomplished by the Cedar River, the Wapsipinicon River and Buffalo Creek. These streams all cross from northwest to southeast and are almost parallel. 7/

Climate

The mean annual temperature of this county for ten years (1930-1939 inc.) was 48 degrees 8/, the average rainfall for 48 years (1882-1930) was 31.22 inches and the growing season was 167 days for thirty-seven years (1893-1930) between the average killing frost dates of April 25 and October 9. 9/

Population

By the U. S. Census of Iowa Territory in 1840 Linn County had a population of 1,373; this number had grown to 3,954 by the State count of 1847 and from that time forward there has never been a recession in the number of inhabitants at any Federal Census. It has a density of 116 per square mile as compared with the State figure of 44. The following table shows the enumeration at ten year periods:

<u>Year</u>	<u>Inhabitants</u>	<u>Urban</u>	<u>Rural</u>
1850	5,444	---	---
1860	18,947	---	---
1870	31,808	---	---
1880	37,237	---	---
1890	45,303	---	---
1900	55,392	35,575	18,817

The foreign born and native white of foreign born and mixed parentage content of this county was 25,410 or 31 per cent of the total population in 1930; of this number those of Czechoslovakian or Bohemian descent far outnumbered those of any other nationality, having 9,851 as compared with their nearest competitor, the Germans who had 4,855. The Irish and Scandinavians had about 2,000 each. Other nationalities had very much smaller representations. 14/

Cooperatives

In 1937 there were 14 cooperative institutions in operation in this county---three elevators, four creameries, one merchandise establishment, two livestock enterprises, one petroleum plant, one fruit and vegetable business, and one milk depot.

As a whole they had 3,084 members of which 2,784 were active and 5,617 persons did business with the fourteen concerns. The selling cooperatives had a business volume of \$873,024 and the purchasing cooperatives did \$342,023 worth of business.

Cooperatives may both buy and sell or they may perform one or the other function exclusively. Purchasing cooperatives buy non-farm commodities for distribution to their members and patrons, and selling cooperatives market farm commodities for their members and patrons. 15/

Fruits

Over 60,000 apple trees were listed in the years of 1884 and 1909 with a production well over 20,000 bushels in each report. In 1934 there were 29,125 trees listed and 18,776 bushels. Peaches were of no consequence until 1909 when 2,579 trees and 498 bushels were listed, but in 1934 there were but 939 trees and 19 bushels reported. Plums and cherries were reported regularly with highest for plums in 1909 when 22,459 trees and 1,437 bushels were listed and cherries had a record of 34,828 trees and 9,586 bushels in the same year. Grapes have always shown a good production; 1909 was the largest year--58,702 vines bearing 374,874 pounds were reported and in 1934 there were 56,023 vines and 183,799 bushels listed. 16/

NOTE REGARDING YIELDS OF CORN.

The crop assessors' statistical breakdown for corn acreage is as follows: (1) all corn, (2) corn husked for grain, (3) corn cut for silage, (4) corn cut for fodder and (5) corn hogged off. A total production is given for each farm which includes only that actually husked. In getting county totals of production the acreage other than that husked is multiplied by the yield (derived by dividing total bushels corn husked by total acres husked) and added to summations of individual farm productions shown as husked. This assumes that acreage not husked would have produced the same yield as that actually husked.

In 1934 and 1936, both poor crop years, separate estimations of corn yield on acreage not husked were made by the state assessors' office because it was felt that farmers in those years would select their best acreages for husking and cut or hog off the rest, which would have a different and lower yield. This separate yield estimation was then multiplied by the acreage not husked and the total added to that reported as husked.

This was done by counties only and not by townships. The township yields for these two years then, are somewhat high since they are based on acreage husked for grain and bushels husked, only. The total corn acreage is shown by township with this yield and any attempt to multiply it by the acreage shown to get total production will result in a too high figure. The county summary table figures for corn yield in 1934 and 1936 have been adjusted for poorer yields on that acreage not husked and these yields may legitimately be multiplied by the acreages shown there to arrive at total productions for the county.

In all other years actual township productions may be derived from the yield and acreage figures shown in the tables since corn yield has been assumed to be equal in all utilizations. The county yield and township yields are therefore consistent in all years except 1934 and 1936.

1939	64852	24223	9949	606	11388	129330

The figures in this table for the years 1870-1935 inclusive have been derived from the Federal Censuses for Iowa. These enumerations have been made as of different dates. Some enumerations were for a base date of January 1, others for a base date of April 1, and others for June 1.

The census enumerations made in 1920, 1925 and 1935 were for January 1. For comparability the enumerations made for the base dates of April 1 and June 1 were adjusted to an equivalent January 1 base. This adjustment procedure places the livestock data of the above table on the one inventory date of January 1.

The figures for 1936, 1937, 1938 and 1939 for all cattle and milk cows are estimates of the Division of Agricultural Statistics of the Iowa Department of Agriculture and those for horses, mules, hogs and sheep are adjusted state farm assessor's figures.

The adjusted county figures for horses, mules, hogs and sheep for the last four years in the table are more nearly accurate than those in Table 24 and comparison with these figures will provide an estimate of the bias displayed by the unadjusted state farm assessor's figures.

* Includes Milk Cows.

The Statistics in this table are biased downward. They are printed only to permit inter-township and inter-annual comparisons. Unless townships are equal in size, comparisons may not be directly made. It is assumed that individual assessors are subject to approximately the same bias. Compare Table 23 for the magnitude of the bias.
